

CLOUD CO-4

1) How is trust established between users and cloud providers?

A) Trust is built through SLAs third-party certifications, transparency tools like audit logs and dashboard and the shared responsibility model where providers secure infrastructure while users secure their data

A critical concept here is the shared responsibility model trust is not entirely on the provider.

Cloud providers secure the infrastructure, while the customer is responsible for securing what they put on top.

2) How does a provider reputation affect user decisions?

Reputation functions as a proxy for trustworthiness when the direct verification is impossible. Most organizations cannot audit AWS data centers themselves so they rely on what the market signals about that providers reliability

Key factors for reputation:-

- Up time history
- Breach disclosure behavior

- Compliance portfolio
- Customer references and case studies
- Analyst positioning

3.) What is types of risk exist in cloud environment

A few risks deserve special emphasis. Misconfigured storage is consistently one of the top causes of cloud data breaches it is a customer-side failure, not a provider failure. ~~Not a~~ Vendor lock in is a slow-burn risk. Organizations that build ~~deply~~ on proprietary services find it prohibitively expensive to migrate later. Shared tenancy is a unique to cloud multiple customers sharing hardware creates theoretical attack surface through side-channel vulnerability

4.) How can organizations minimize cloud security risks?

Organizations should apply defense in depth enforce least privilege IAM with mandatory MFA, encrypt data at rest and in transit with customer-managed keys. continuously monitor using SIEM tools and audit logs.

Use Infrastructure as code with automated policy scanning to catch misconfigurations before deployment.

5) Compare trust, reputation and risk in real world cloud useage scenarios?

In healthcare provider reputation and certification are non-negotiable due to patient data due to diligence but vendor HIPAA liability. In fintech startups reputation satisfies investor due diligence but vendor lock-in becomes the dominant risk
